

Q3 logistics review

Prepared by the operations team. This document is embedded in `pdf-embed.canvas` twice: once as a whole PDF, and once at its second page, to exercise the canvas PDF file node.

Summary

Shipment volume grew 12% quarter on quarter, led by the northern corridor. The southern depot remains the bottleneck: dwell time there is 1.8 days against a 0.9-day target, and the shortfall is almost entirely inbound trailer scheduling.

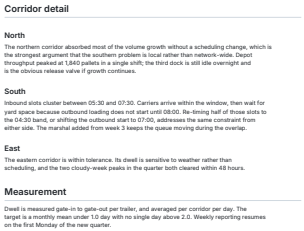

Corridor	Volume	On time	Dwell
North	41,200	96%	0.7 d
South	28,900	88%	1.8 d
East	19,400	93%	1.1 d

Actions

1. Re-time the southern inbound slots away from the 06:00 peak.
2. Add one yard marshal on the late shift from week 3.
3. Re-measure dwell weekly until it holds under 1.0 day for a month.

Notes

The figures above are provisional: two carriers had not reported by the cut-off. Next revision is due with the November board pack.

Corridor detail

North

The northern corridor absorbed most of the volume growth without a scheduling change, which is the strongest argument that the southern problem is local rather than network-wide. Depot throughput peaked at 1,840 pallets in a single shift; the third dock is still idle overnight and is the obvious release valve if growth continues.

South

Inbound slots cluster between 05:30 and 07:30. Carriers arrive within the window, then wait for yard space because outbound loading does not start until 08:00. Re-timing half of those slots to the 04:30 band, or shifting the outbound start to 07:00, addresses the same constraint from either side. The marshal added from week 3 keeps the queue moving during the overlap.

East

The eastern corridor is within tolerance. Its dwell is sensitive to weather rather than scheduling, and the two cloudy-week peaks in the quarter both cleared within 48 hours.

Measurement

Dwell is measured gate-in to gate-out per trailer, and averaged per corridor per day. The target is a monthly mean under 1.0 day with no single day above 2.0. Weekly reporting resumes on the first Monday of the new quarter.

Embedded PDFs

Both cards are `file` nodes pointing at `report.pdf`, a compliant two-page PDF rendered by makesPDF itself.

- The left card shows the whole file — page 1, contain-fitted into its rect.
- The right card carries `#page=2`, Obsidian's page subpath, so it shows page 2 of the same file. A subpath outside the document falls back to page 1 with a warning.

A PDF whose fonts are not embedded (or that is encrypted, CMYK, malformed, over 5MB, or the 11th on a board) renders its placeholder card instead, and the export reports why in `layoutWarnings`.
